

sed

Sed (Stream Editor) is a powerful text stream editor. It's used for text manipulation, including search and replace, insertion, deletion, and more, based on regular expressions.

awk

AWK is a versatile text processing tool. It's primarily used for data manipulation, text extraction, and report generation. It operates on a line-by-line basis and is particularly useful for working with structured data.

echo

The echo command is used to print text or variables to the standard output (usually the terminal). It's commonly used for displaying messages or output from shell scripts.

grep

grep is used for searching text using regular expressions. It scans text and outputs lines that match the specified pattern.

ngrep

ngrep is a network packet analyzer tool that allows you to search for patterns in network traffic. It's useful for monitoring network activity and filtering packets based on regular expressions.

ripgrep

ripgrep is a line-oriented search tool that recursively searches your current directory for a regex pattern. It's designed to be fast and efficient, making it a popular choice for code searching and text processing.

agrep

agrep stands for "approximate grep." It allows you to perform approximate string matching, which can be useful for finding similar or misspelled words in text.

ugrep

ugrep is a command-line search tool that supports recursive search, regex patterns, and Unicode. It aims to be a feature-rich and efficient alternative to traditional grep.

ack

ack is a tool for searching text and code. It's designed to be developer-friendly, and it's capable of recognizing common code-specific file types and ignoring version control directories by default.

cut

The cut command is used for extracting sections from lines of files or data streams. It's often used to isolate specific fields or columns from text.

sort

sort is used for sorting lines of text files or data streams in ascending or descending order. It's helpful for organizing data.

uniq

uniq is used to remove duplicate lines from a sorted file or data stream. It's often used in conjunction with sort.

diff

diff is a tool for comparing the contents of two text files and highlighting the differences between them. It's often used for code and document comparisons.

tac

tac is the reverse of cat. It outputs the lines of a file in reverse order, displaying the last line first and so on.

cat

cat is short for "concatenate." It's used to display the contents of one or more files, or to combine multiple files into a single output.

printf

printf is used to format and print text in a specific way. It allows you to control the output format, including the width, precision, and alignment of data.

comm

comm is used to compare two sorted files line by line and display lines that are unique to each file or common to both.

less/more

These are both pager programs that allow you to view text files one screen at a time. They are useful for browsing large files without overwhelming your terminal.

tail

tail displays the last few lines of a file. Like head, it also defaults to showing the last 10 lines but can be configured differently.

head

head displays the first few lines of a file. By default, it shows the first 10 lines but can be configured to display a different number of lines.

jq

jq is a command-line JSON processor. It's used for querying, manipulating, and formatting JSON data. It's especially handy for parsing JSON in shell scripts.

tr

tr stands for "translate." It's used for translating, deleting, or squeezing characters in a text stream. It's often used for character-level transformations.

ccze

ccze is a tool that colorizes log files or text input, making it easier to read and understand logs and other textual data.

csvcut

csvcut is a utility for working with CSV (Comma-Separated Values) files. It allows you to select specific columns from CSV data.

nl

nl is used to add line numbers to the lines of a text file or data stream.

rev

rev reverses the characters in each line of a text file or data stream.

wc

wc (word count) is used to count the number of lines, words, and characters in a text file or data stream.

paste

paste is used to merge lines from multiple files or data streams side by side. It's commonly used for combining data from different sources.

vimdiff

vimdiff is a command to launch the Vim text editor in diff mode. It's used for visually comparing and merging text files within the Vim environment.

watch

The watch command repeatedly runs the specified command at regular intervals (by default, every 2 seconds) and displays the command's output on the terminal.

ag

The Silver Searcher, commonly known as "ag," is another code searching tool that's optimized for speed. It's particularly popular among programmers for searching through large codebases.

pt

The Platinum Searcher is yet another code searching tool that focuses on speed and efficiency. It's similar to ag and ripgrep in terms of usage.
