

LS

Lists files and directories in the current directory. It's a basic command to get a quick view of what's inside any directory.

CP

Copies files and directories. A straightforward way to duplicate files and create backups.

MV

Moves or renames files and directories. Handy for organizing and renaming items in your system.

RM

Removes files and directories. Use with caution, as deletions are permanent.

MKDIR

Creates a new directory. Ideal for organizing files into separate folders/directories.

CD

Short for change directory. Changes the current directory. Use this to navigate through different directories.

PWD

Prints the current working directory, showing your exact location in the directory structure.

GREP

Everyone's favorite. Searches for a specified pattern in files. Perfect for locating specific lines or words within files.

FIND

Searches for files and directories based on conditions you specify. Extremely flexible and powerful for locating items.

CAT

Concatenates and displays file content. Great for viewing file contents directly in the terminal.

ECHO

Displays a line of text or a variable value. Often used in scripts to output information or messages.

TOP

Displays system resource usage and running processes. Useful for monitoring system performance and process activity.

PS

Shows a snapshot of current processes. Use this to identify running processes and their details.

WGET

Downloads files from the web. Ideal for grabbing files or resources directly from URLs.

SSH

Connects to a remote machine using SSH protocol. Essential for secure access to remote systems and servers.

SUDO

Executes a command with root/admin privileges. Required for commands that need elevated permissions.

CHMOD

Changes the permissions of files and directories. Necessary for controlling who can access or modify files.

CHOWN

Changes the ownership of files and directories. Important for setting who controls or has access to specific files.

GZIP

Compresses files using the gzip algorithm. Useful for saving storage space and making file transfers faster.

TAR

Short for tape archive. Archives files and directories into a single file, often used for backups or packaging files.

MAN

Displays the manual pages for other commands. Think of it as your built-in Linux help system.
